Assigning static IP address	9
Enabling remote desktop.....	12
Renaming server.....	15
Conclusion.....	19

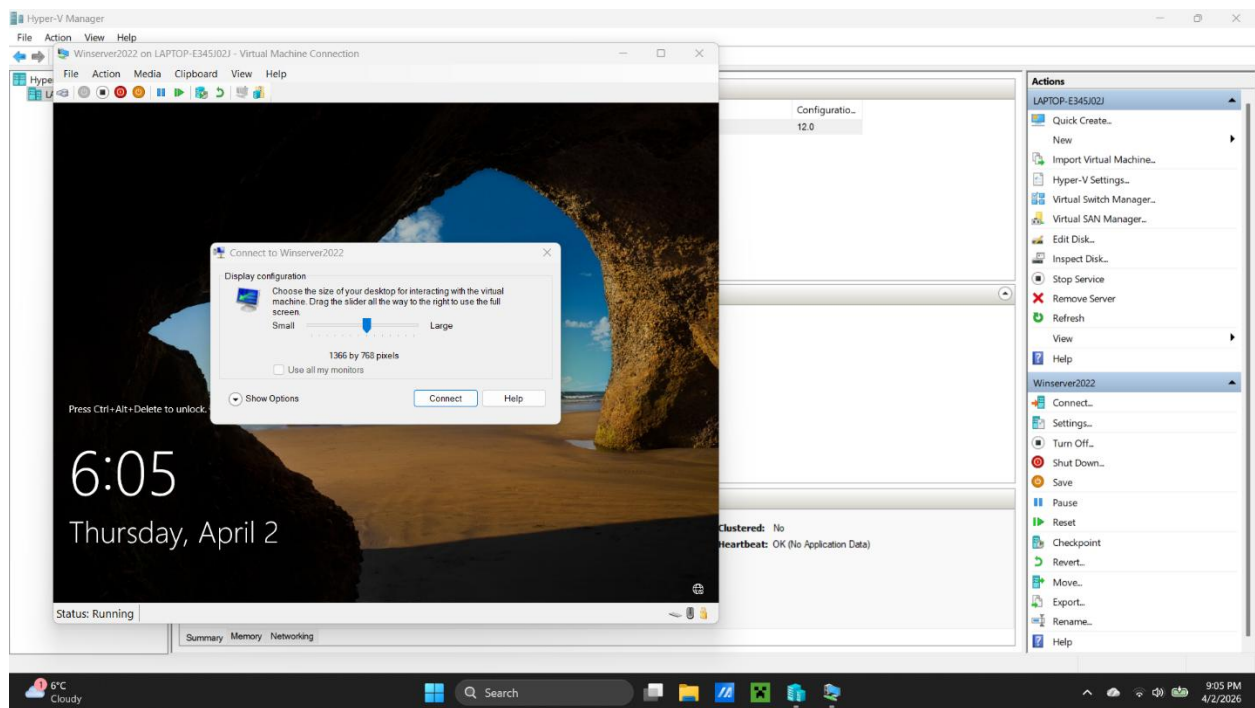

Checking for system update

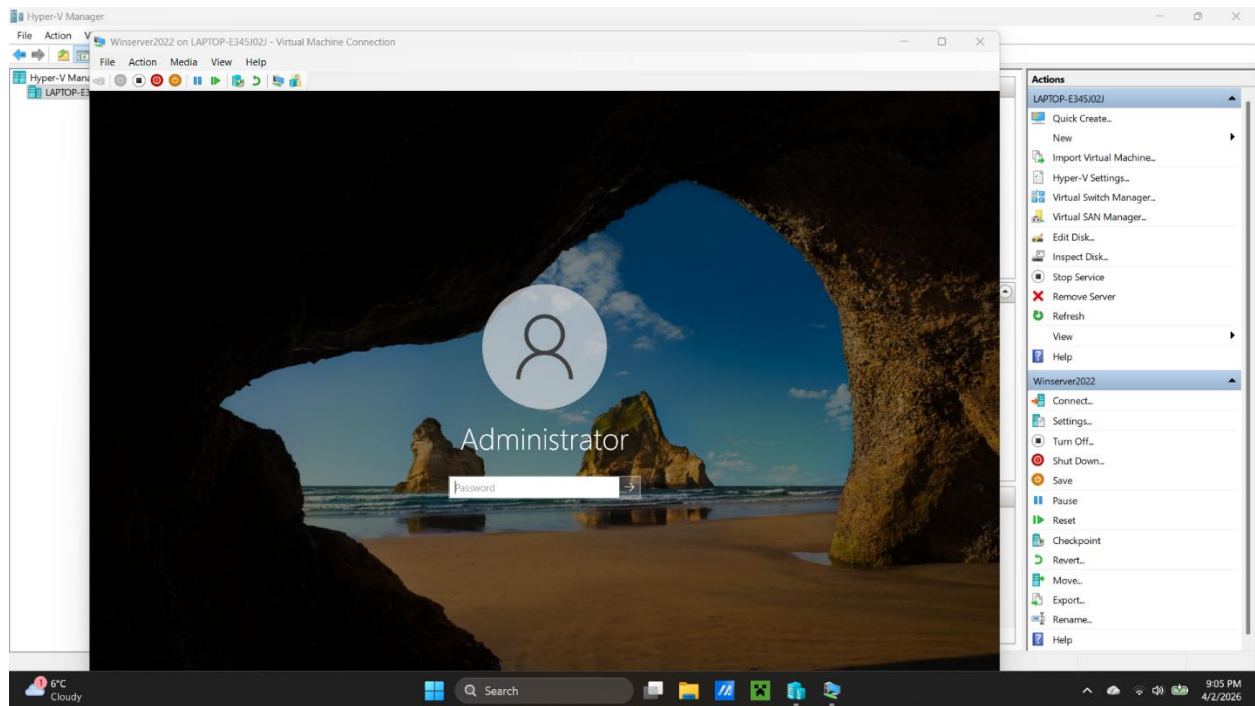

First, I opened the virtual machine that I made earlier.

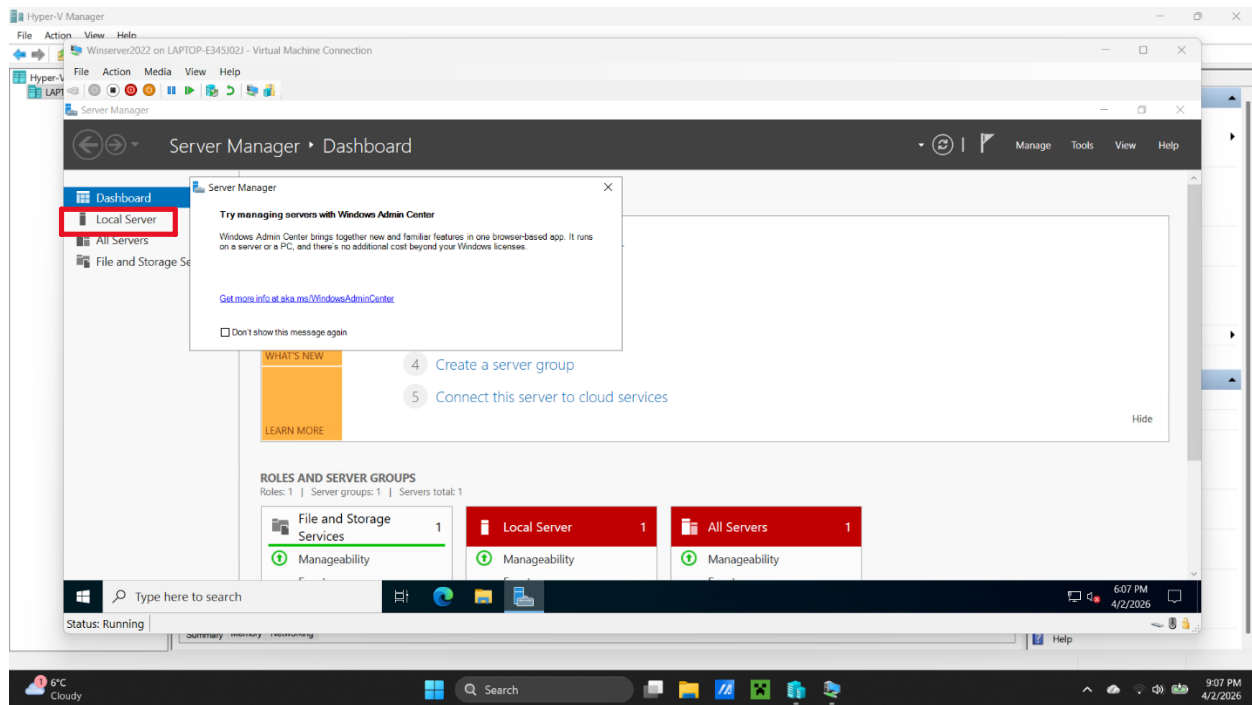

After that, I clicked on start button.

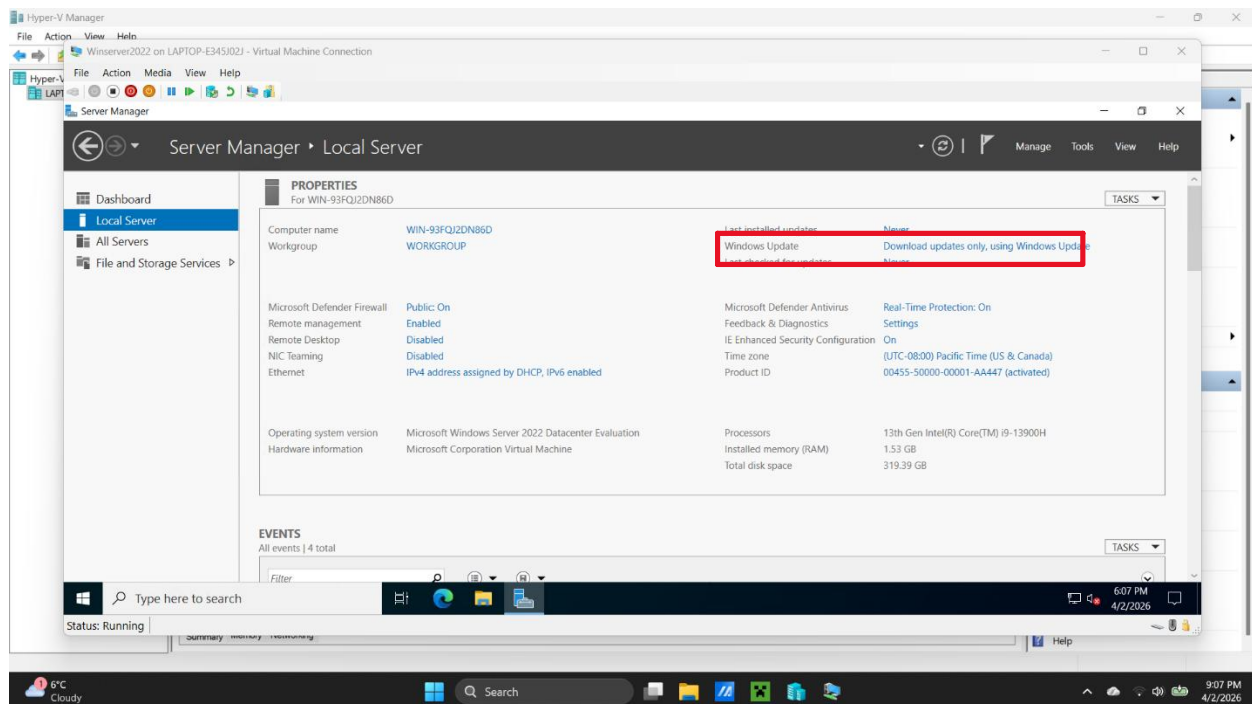

Then, this interface can be seen. Here I just clicked on connect.

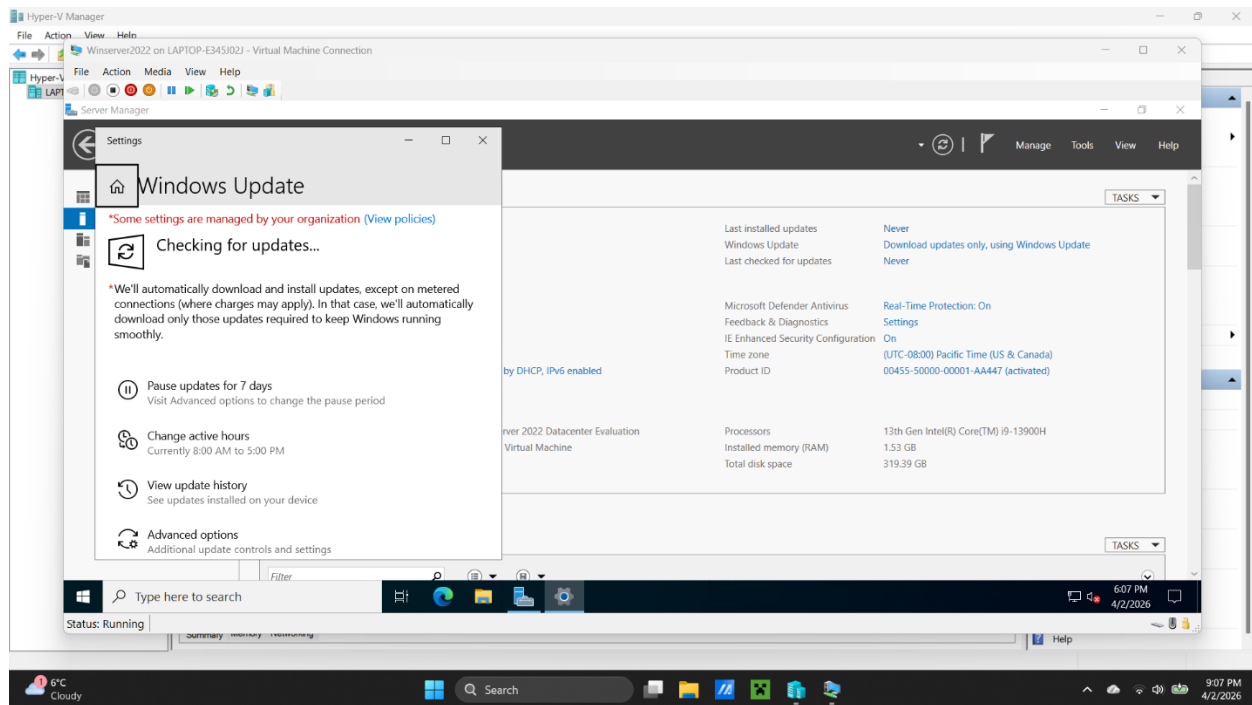

After that, I entered password of my system and then logged into it.

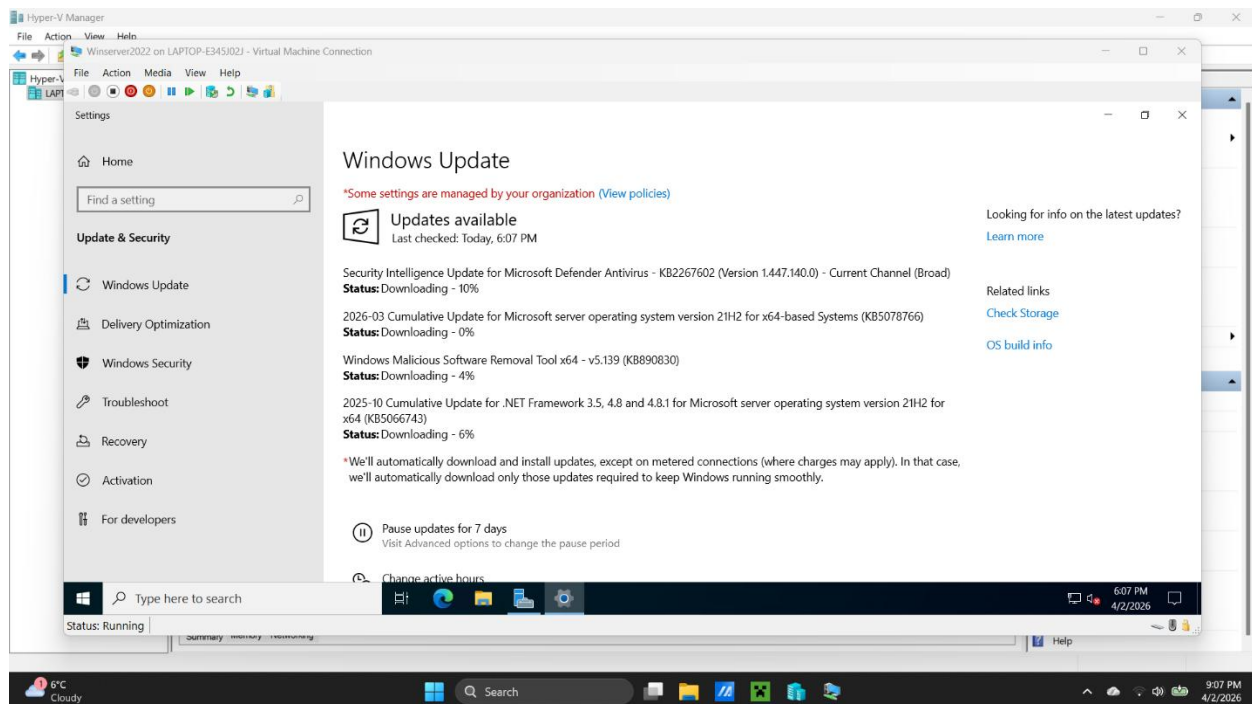

Then, this server manager dashboard can be seen. Here, I clicked on local server.

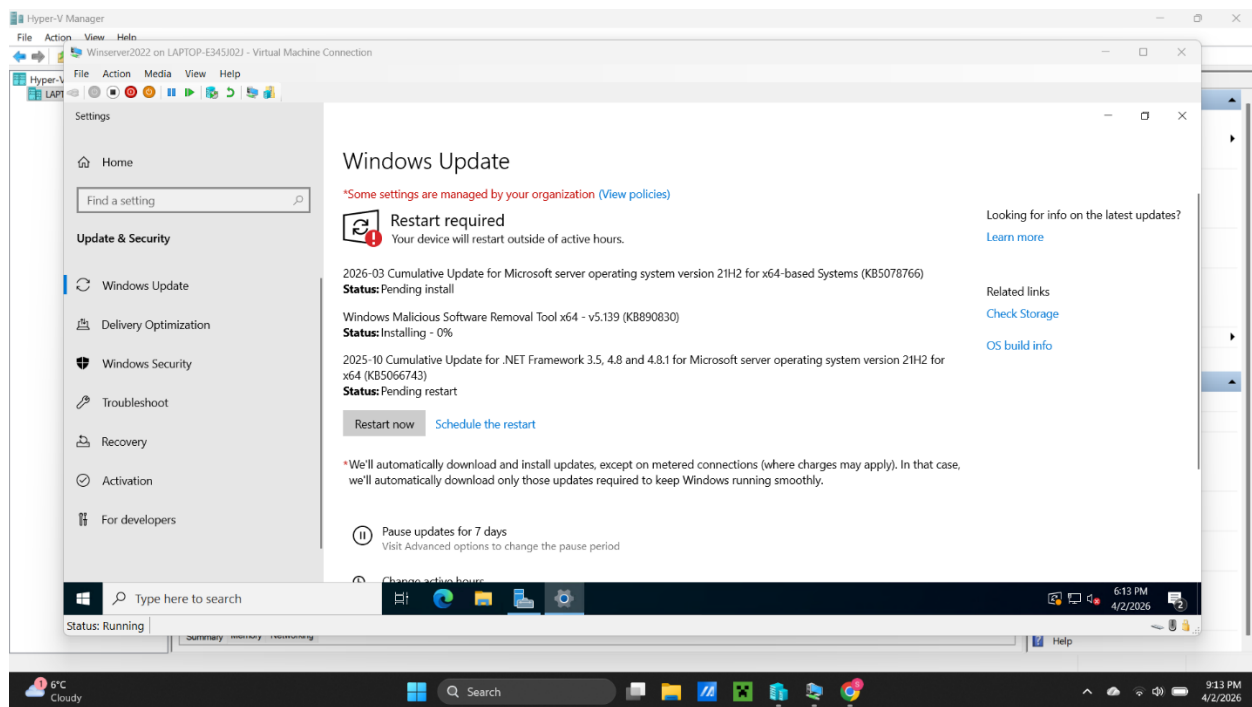

In local server, information about this server can be seen. Then, I clicked on windows update for updating my system.

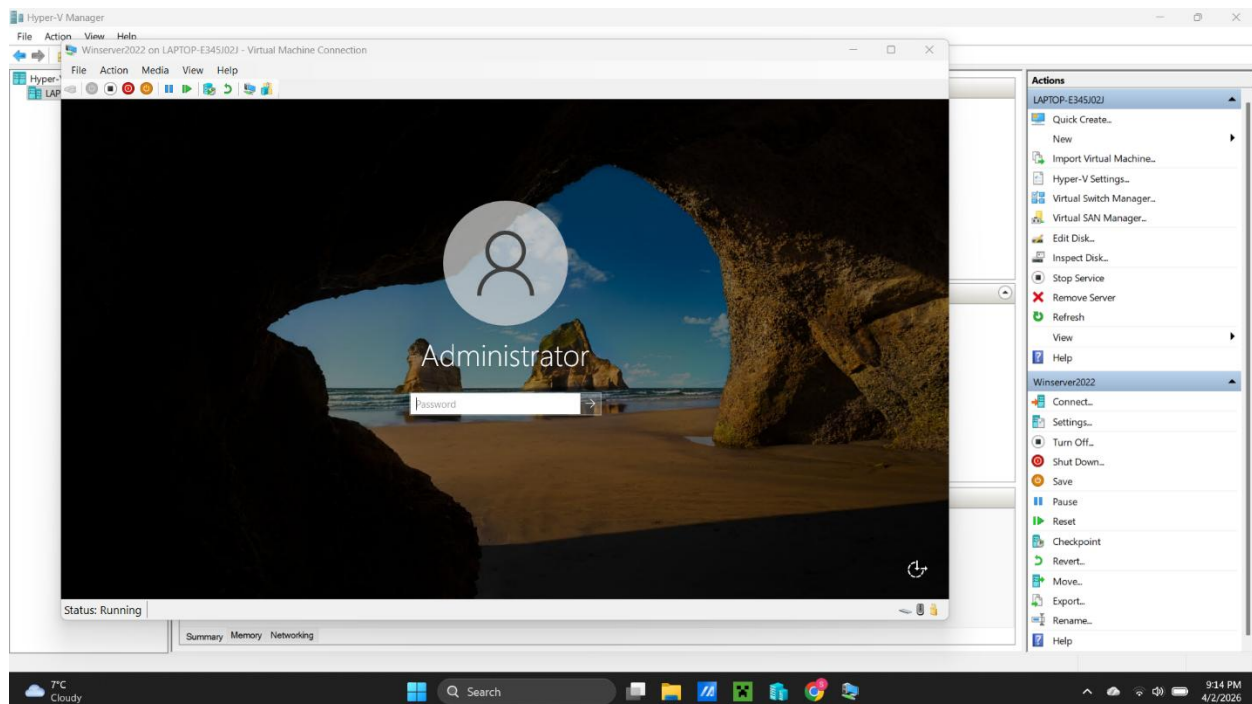

After that, this interface of windows checking for updates can be seen.

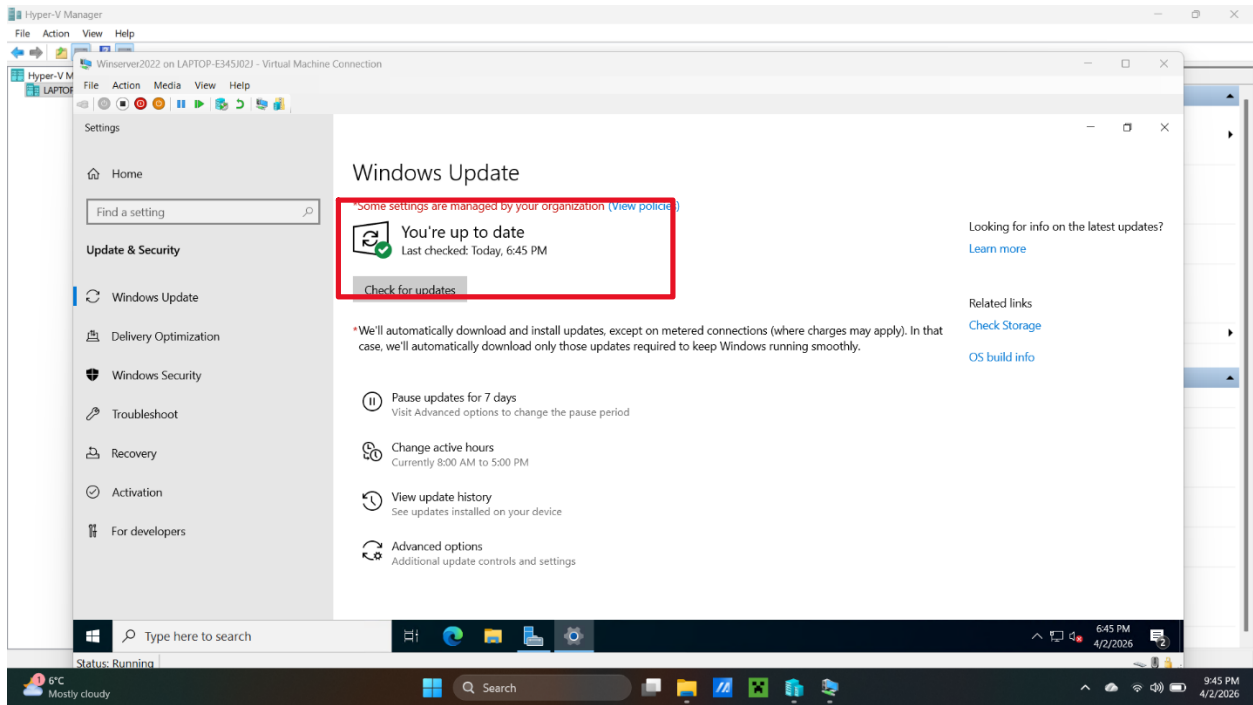

Then, I have got three updates that need to be done.

After that, to completely install those updates I restarted my system.

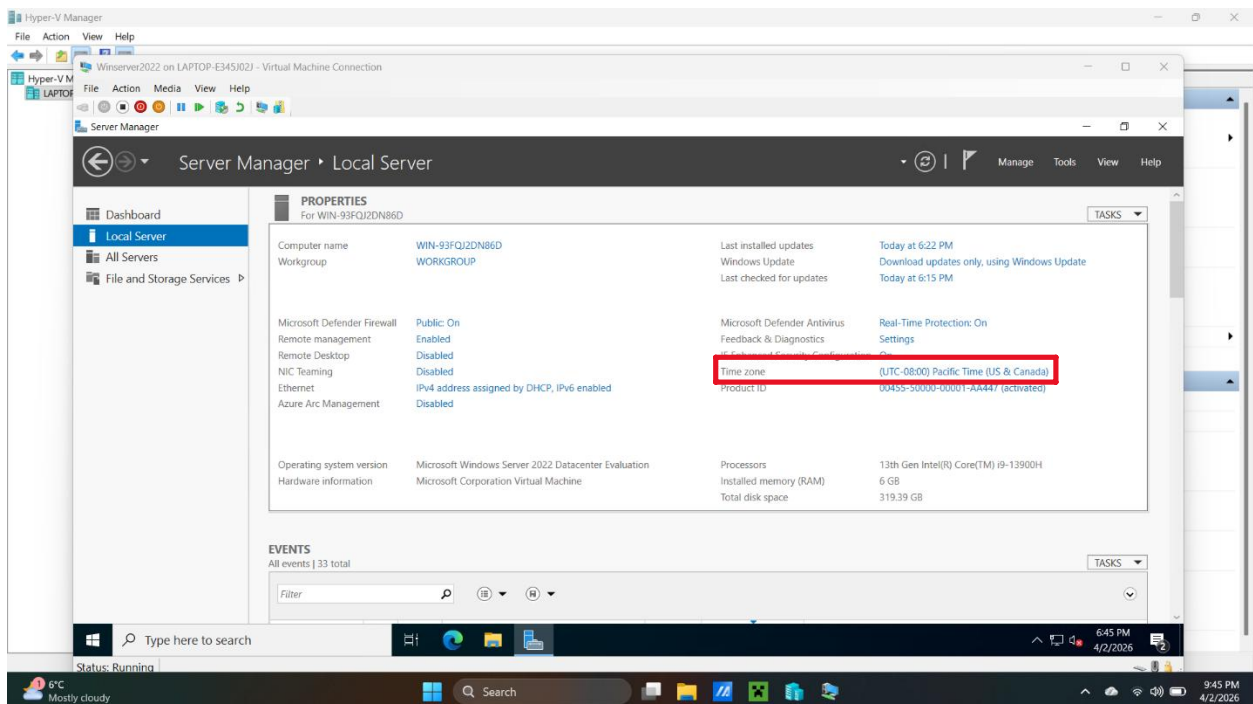

After restarting my VM I again log into it.

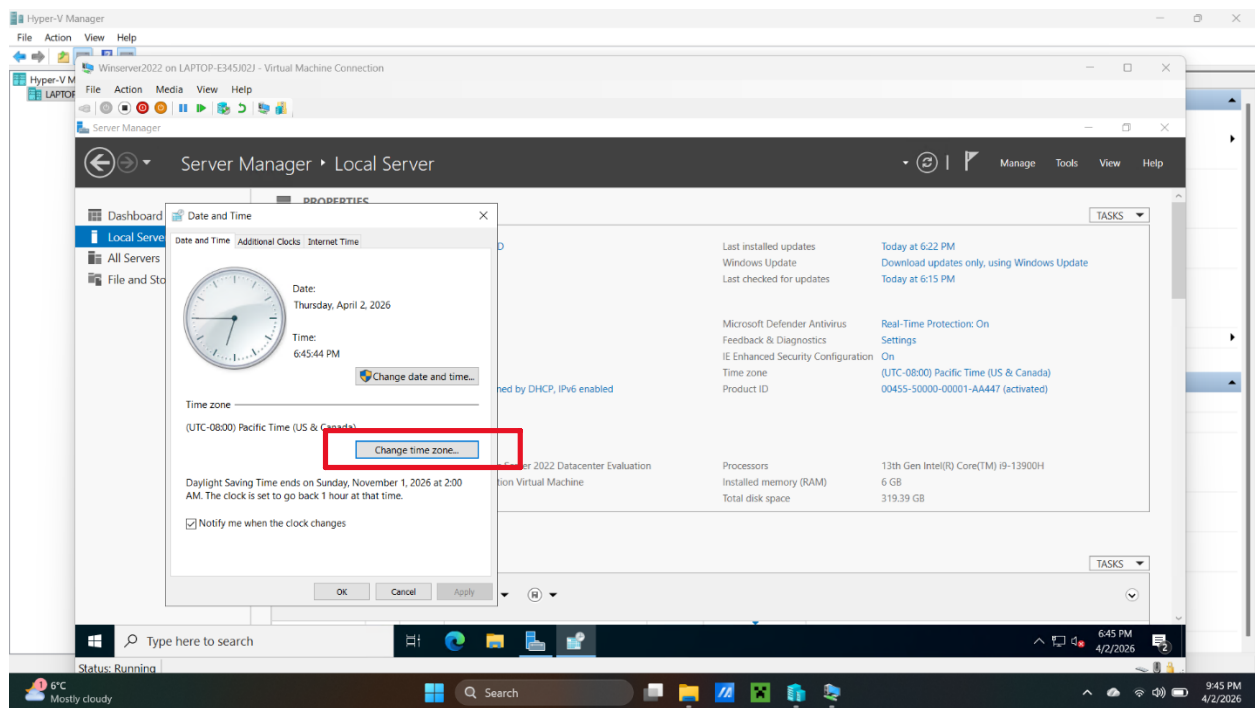

Here, now my system is up to date.

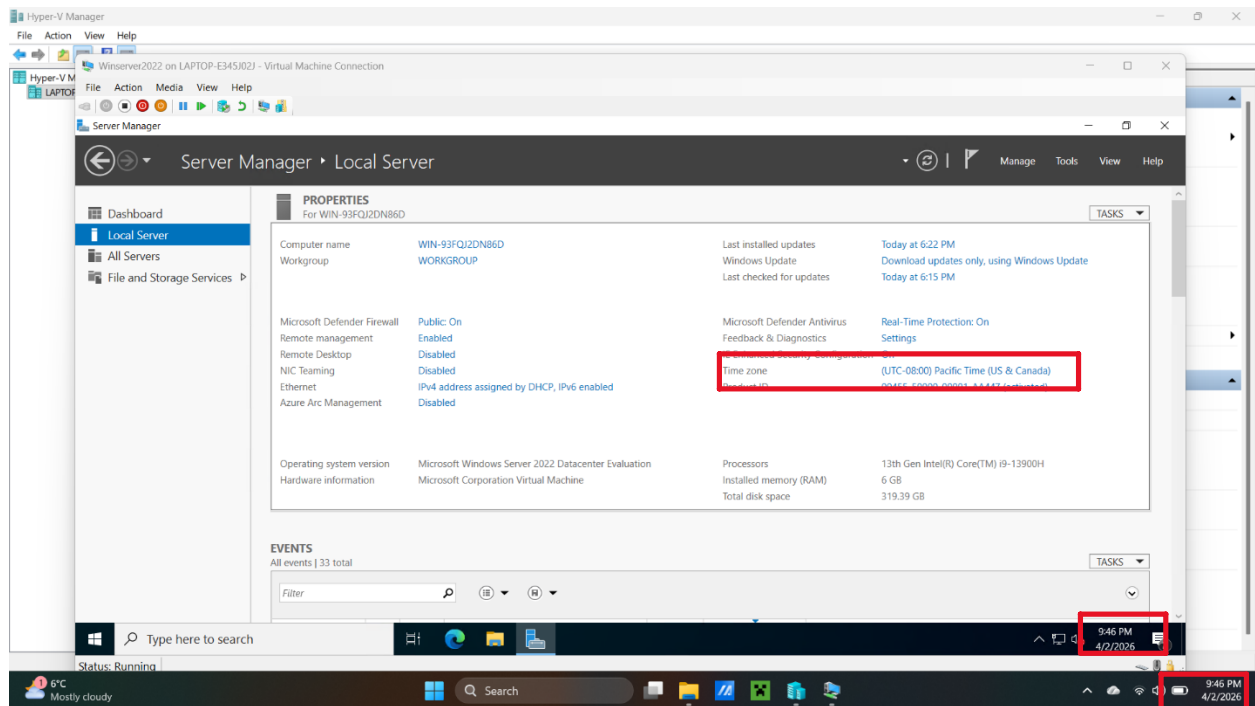

Setting up time zone

Following that, I clicked on time zone to change time of my system.

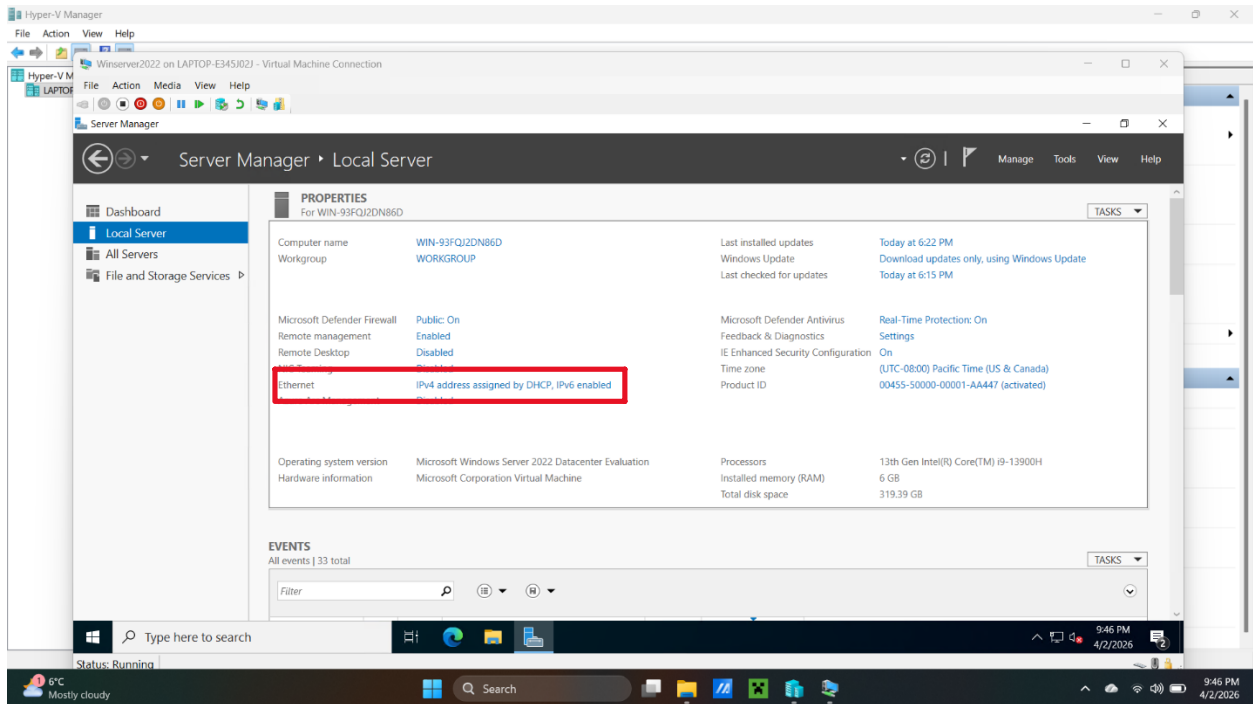

I updated the time zone, clicked apply, and returned to the dashboard.

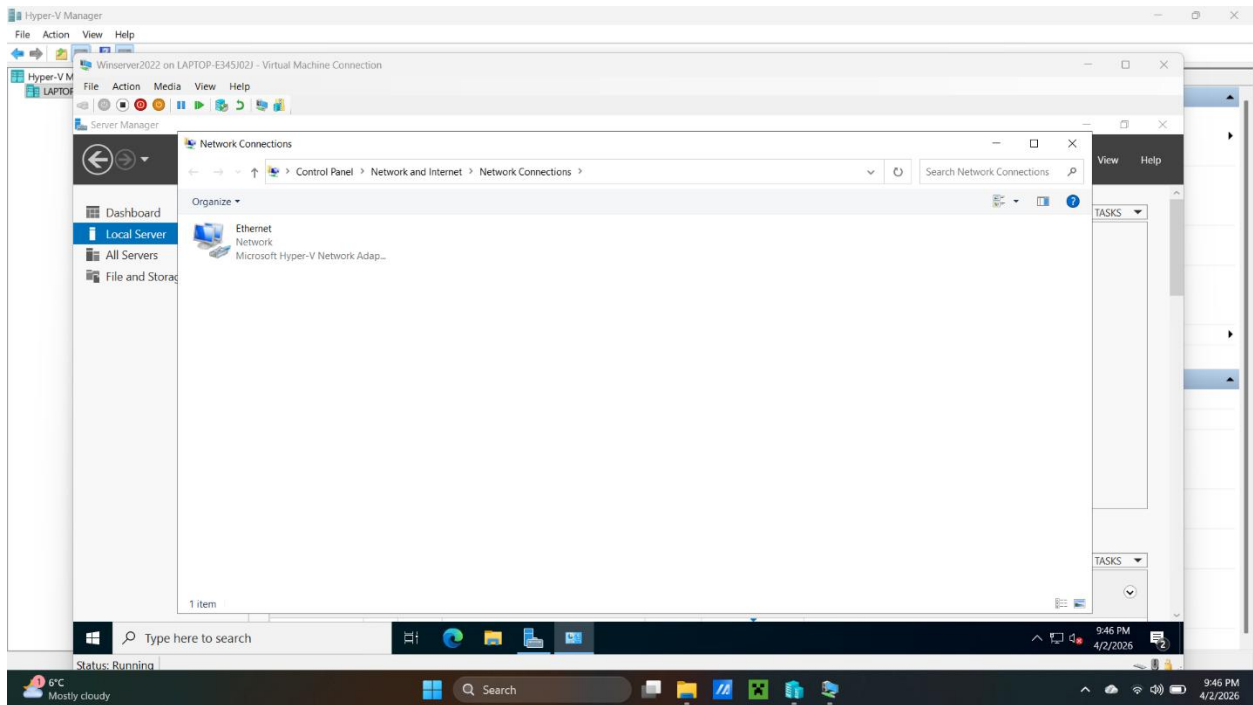

Here I have successfully changed it.

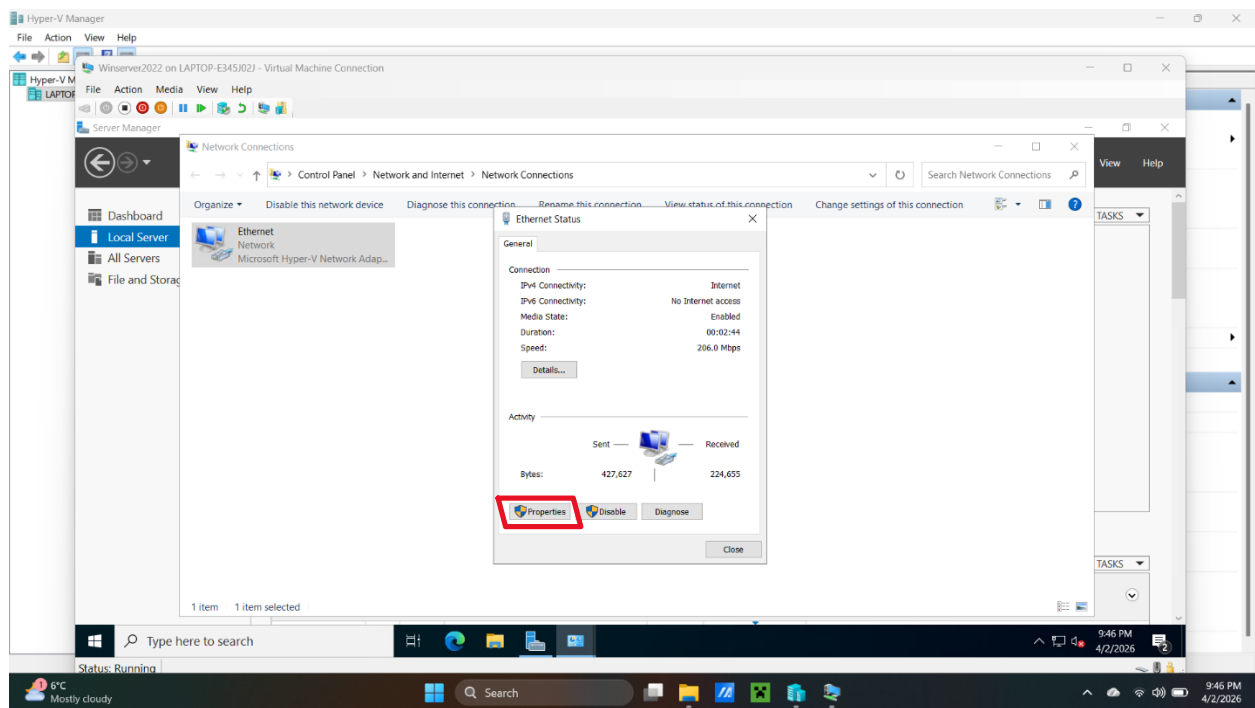

Assigning static IP address

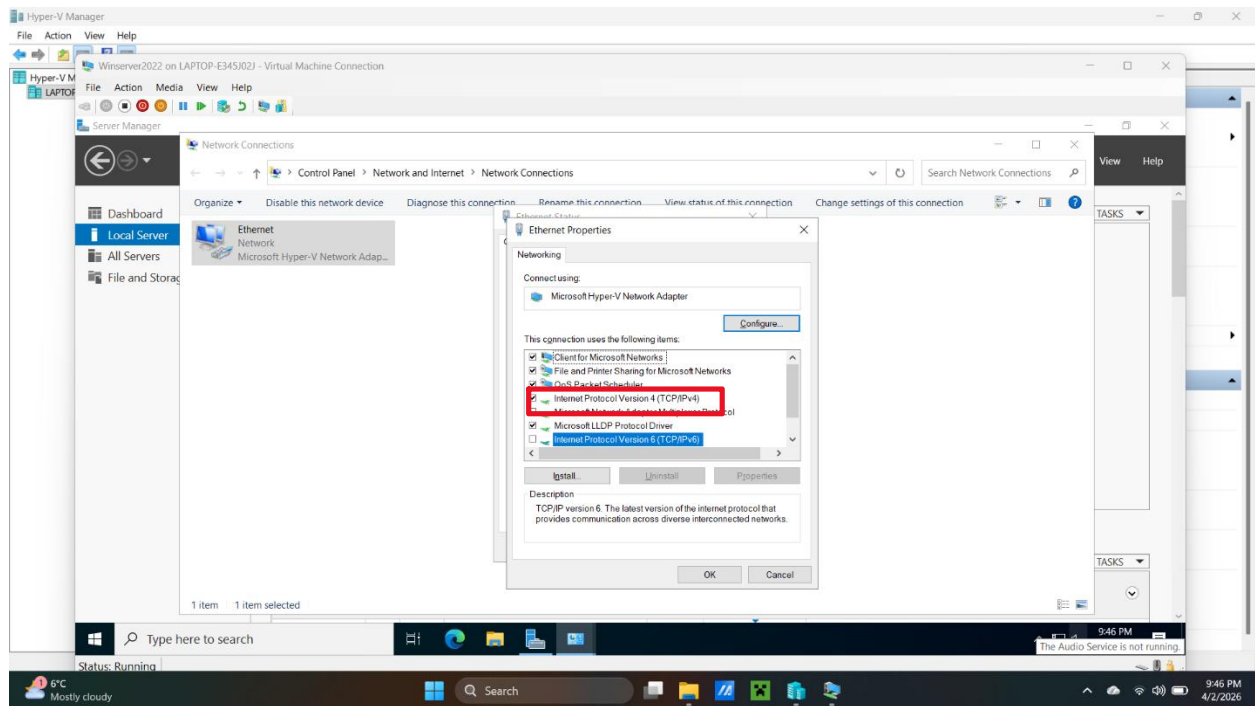

Following that, I clicked on ethernet to assign static IP address.

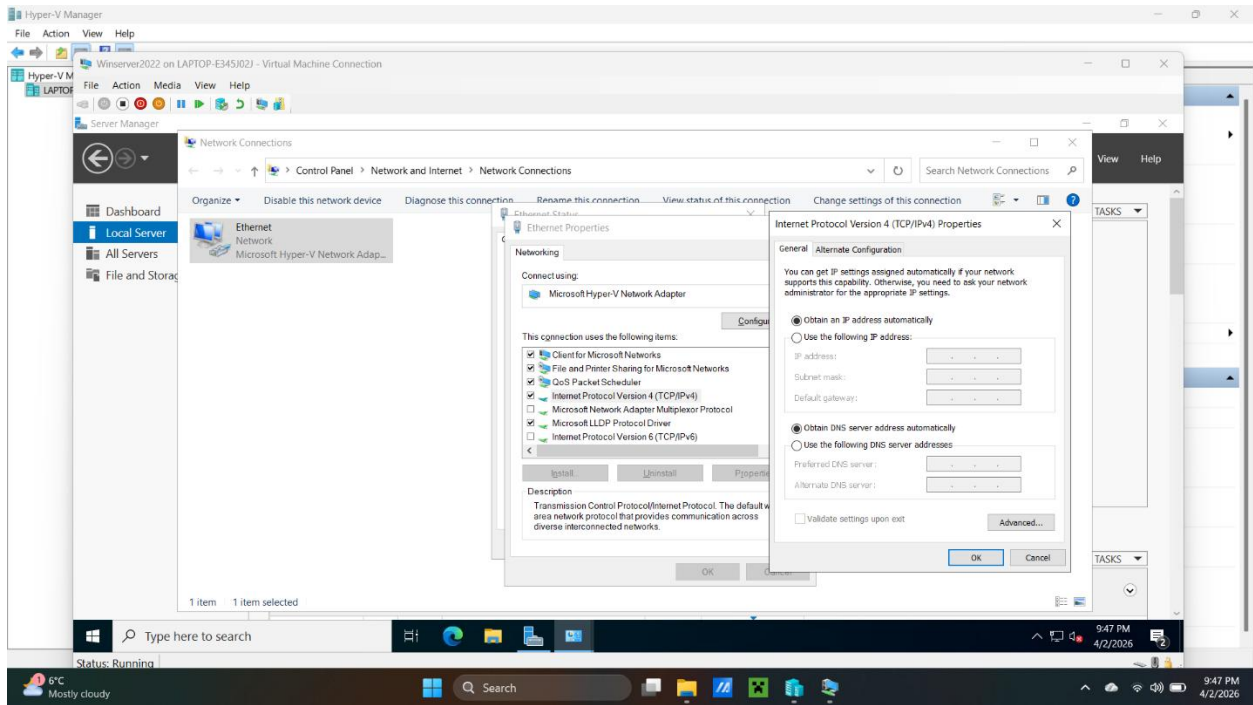

Then, this interface can be seen. Here, I clicked on ethernet option.

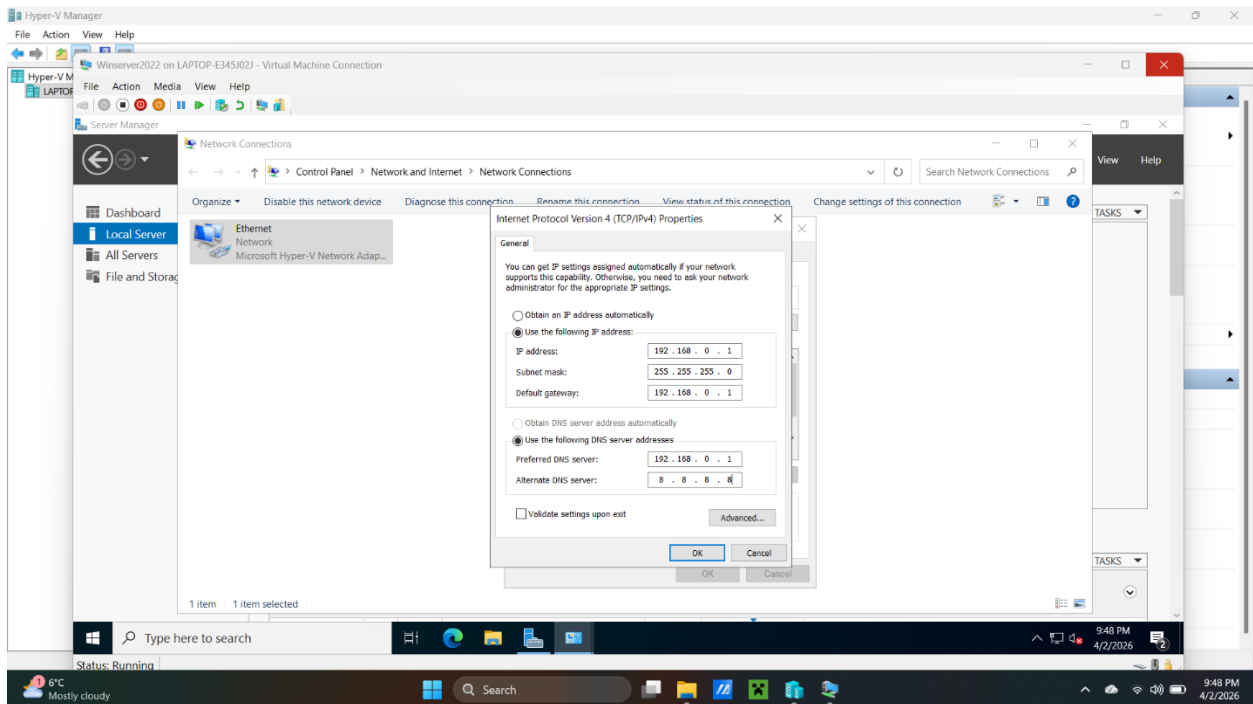

Then in this interface, I clicked on properties.

Then, I clicked on Internet protocol version 4(TCP/IP) and selected its properties.

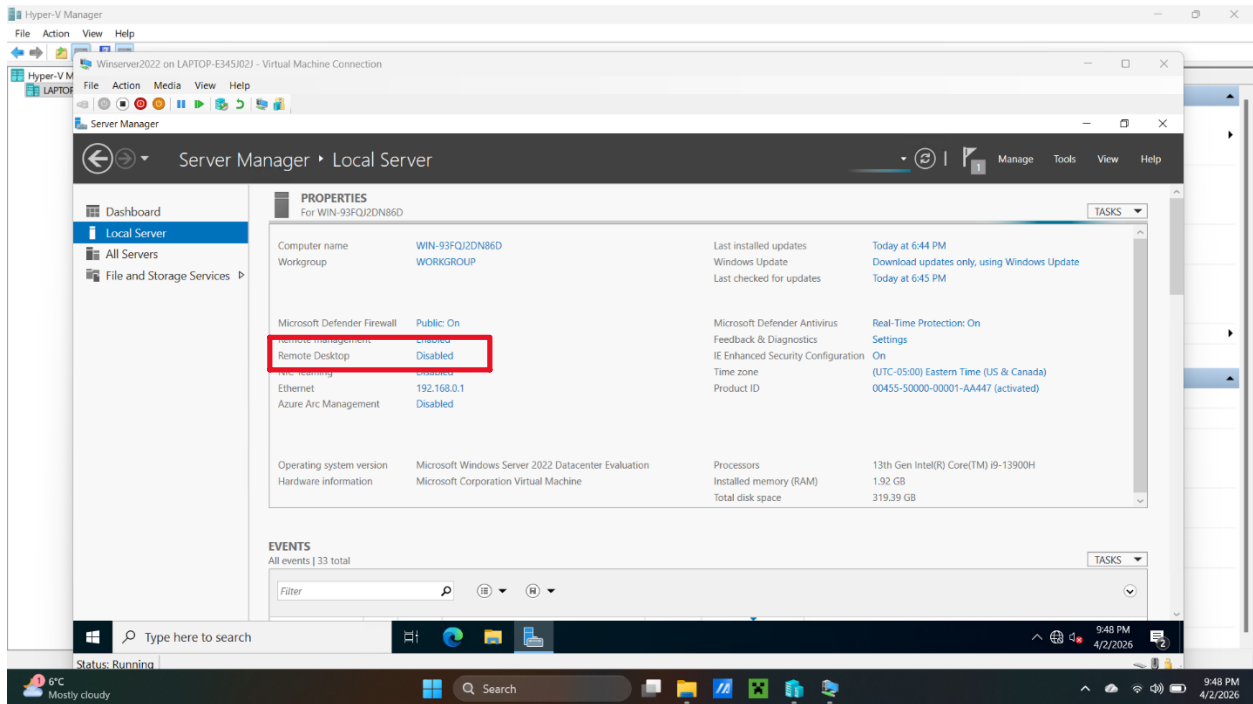

Then, I got the above interface to set the static IP address of my system.

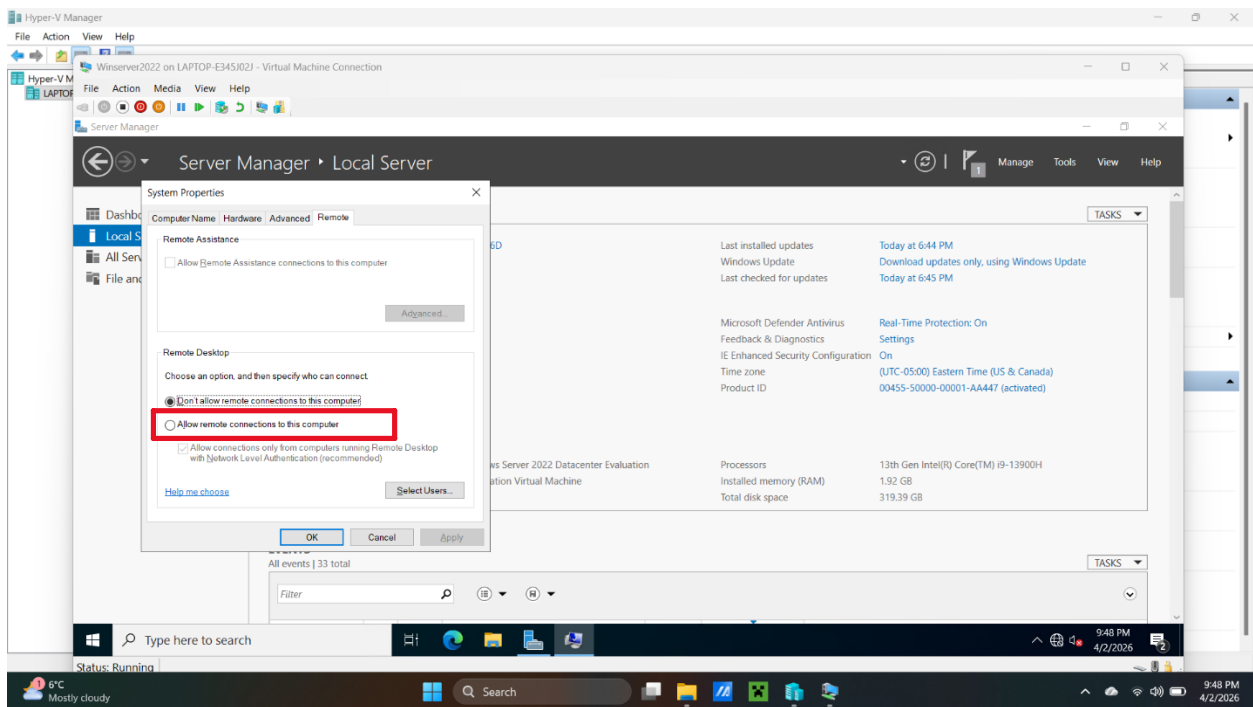

Then, I gave my system following IP address as shown above.

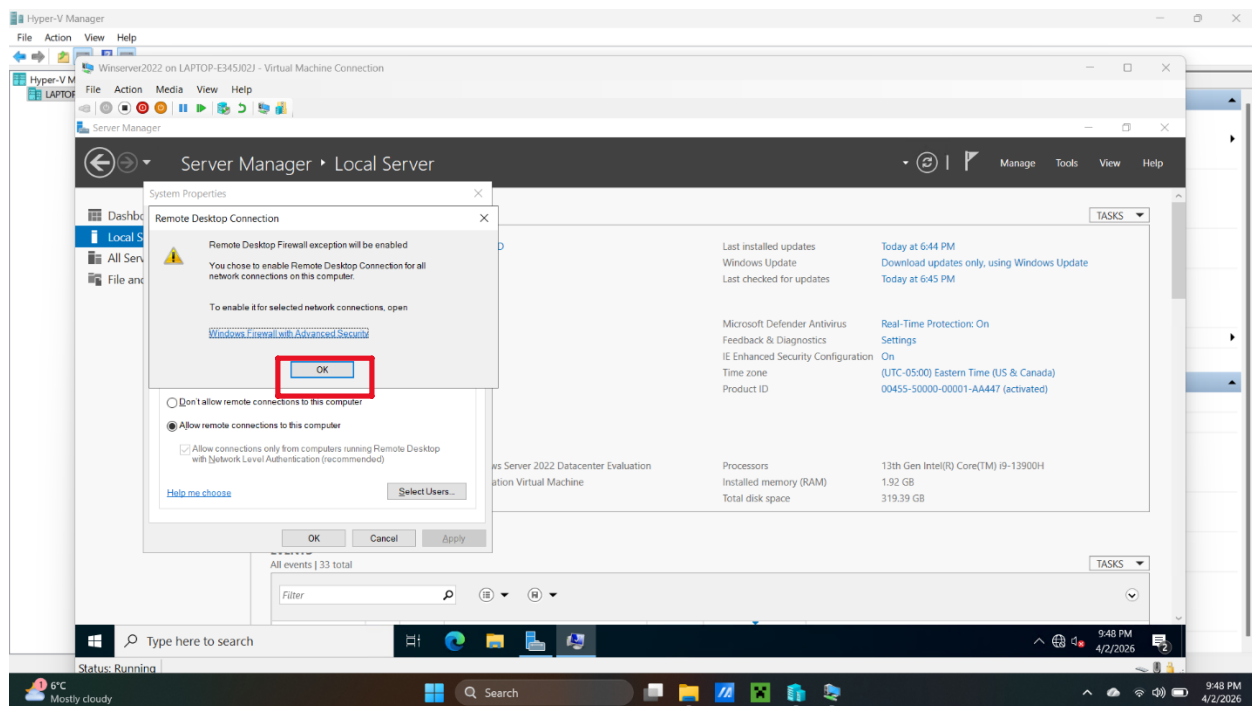

Enabling remote desktop

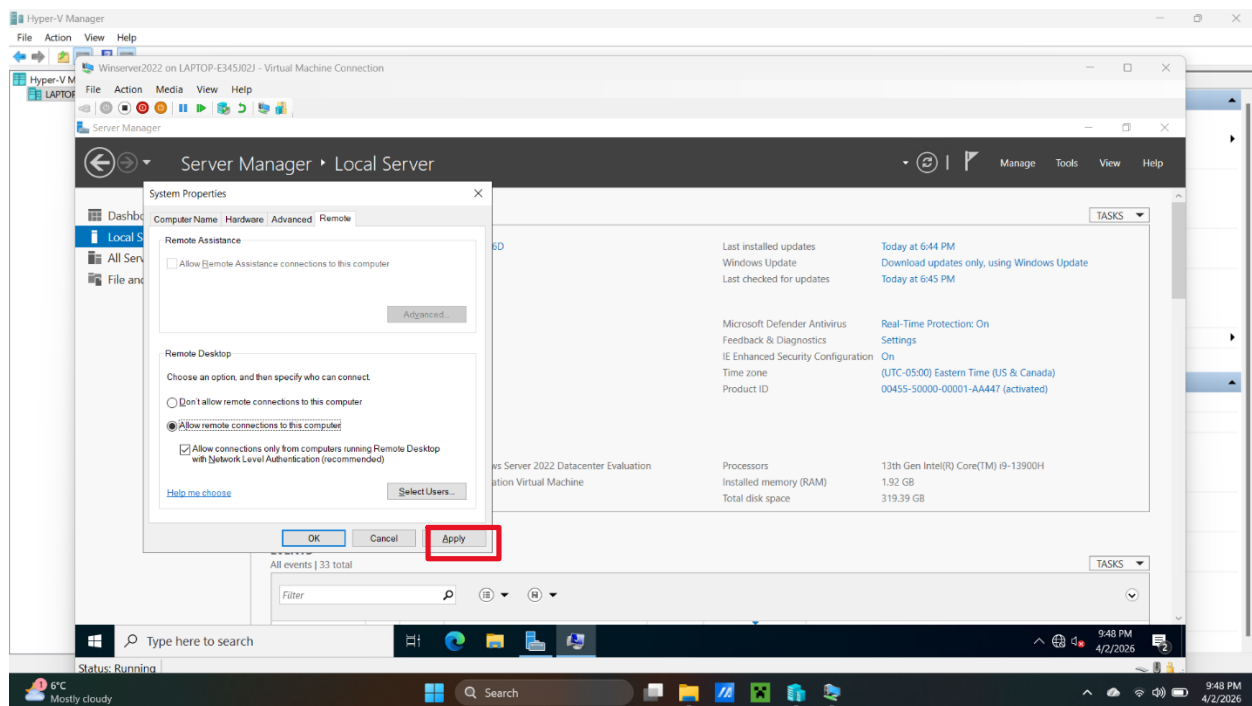

Again, I returned to local server dashboard, and I clicked on remote desktop.

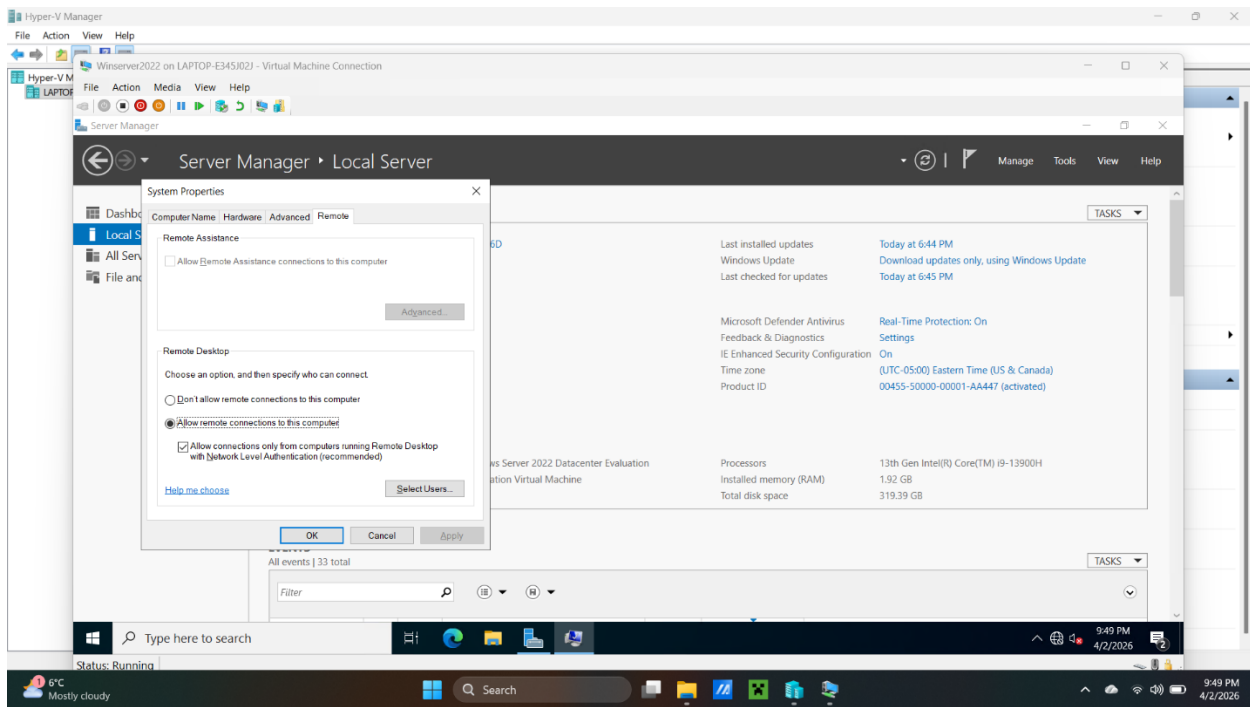

Following that, I clicked on allowing remote connection to the computer.

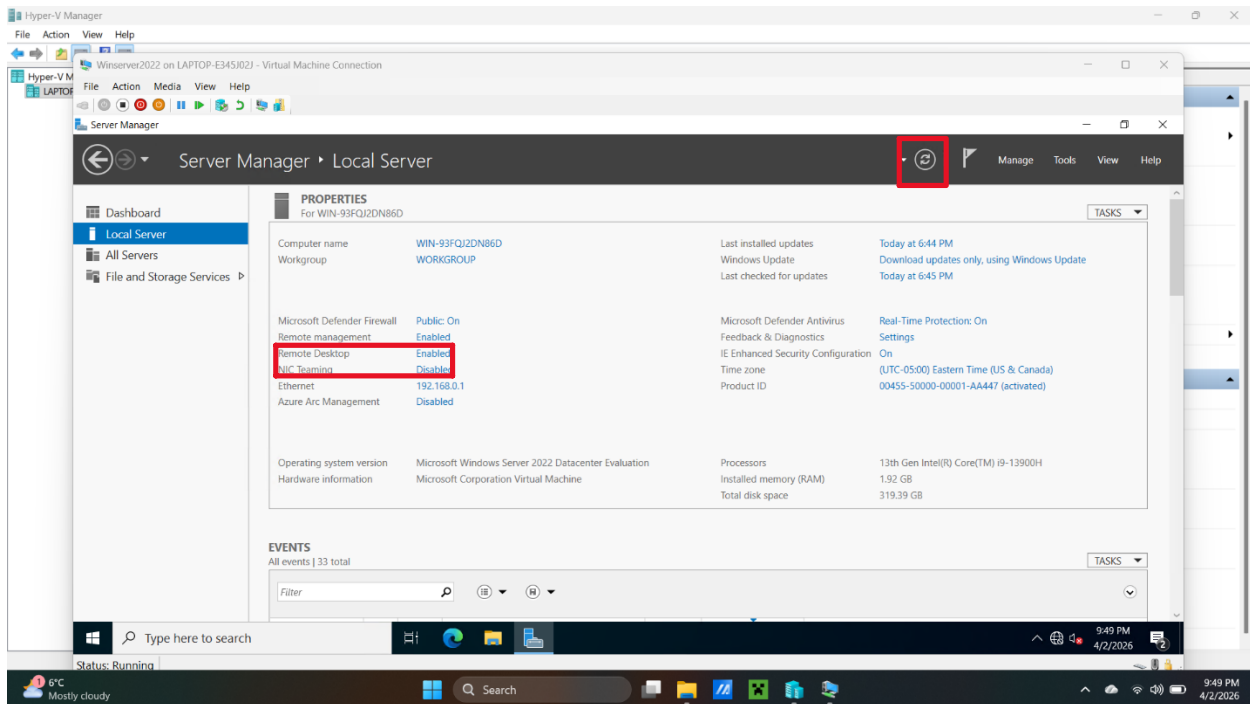

Then, I clicked on ok button.

After that I clicked on apply button to confirm the changes I made just now.

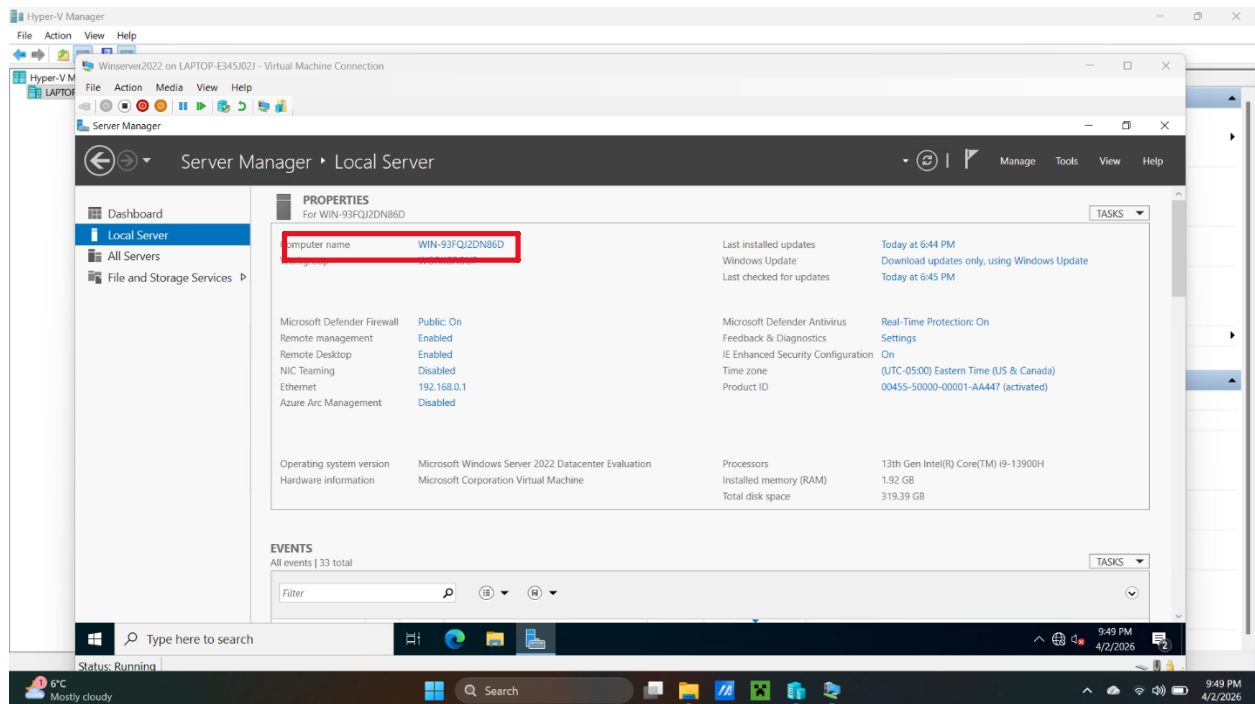

Then, I clicked on ok button.

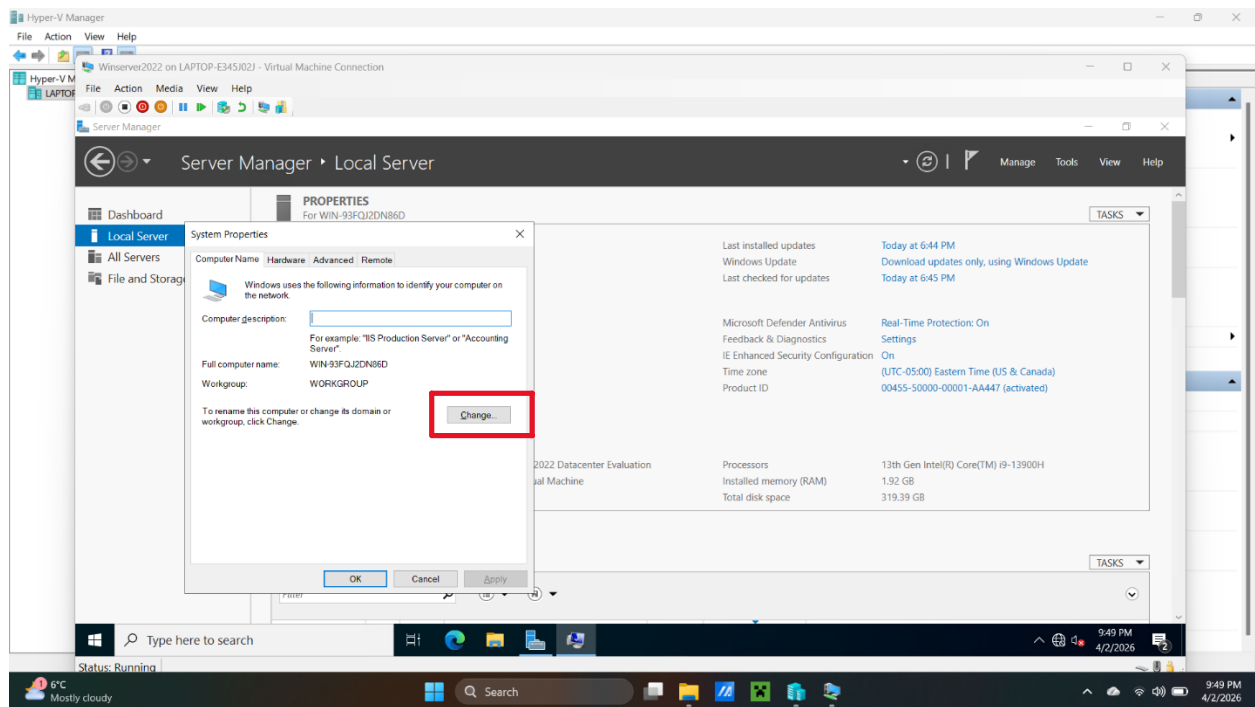

Then, I refreshed the local server dashboard and refreshed it to see the changes.

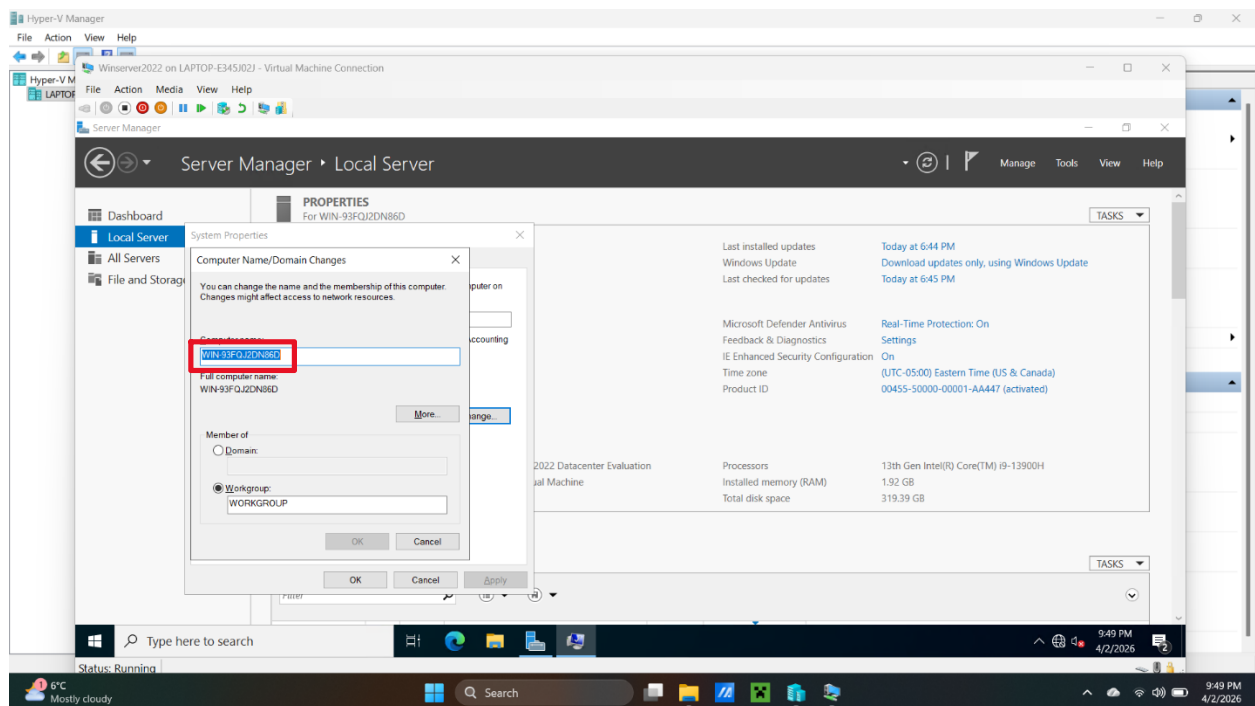

Renaming server

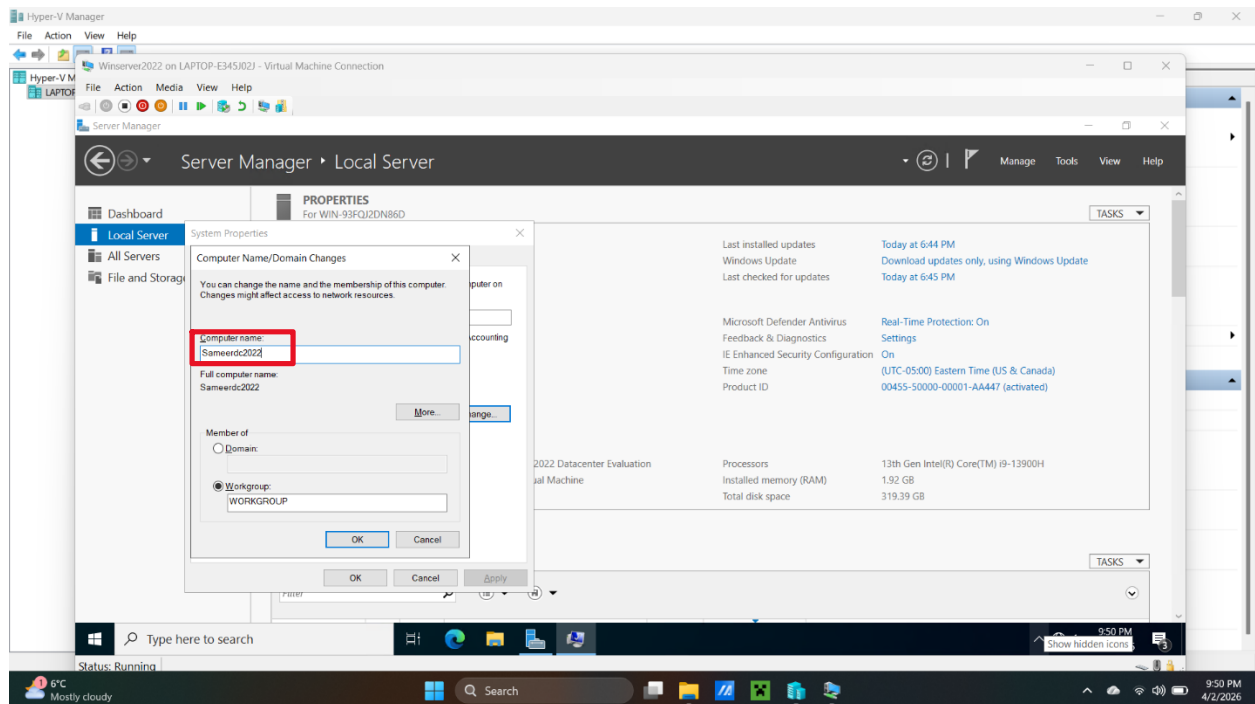

After that, I clicked on computer name to change name of the computer.

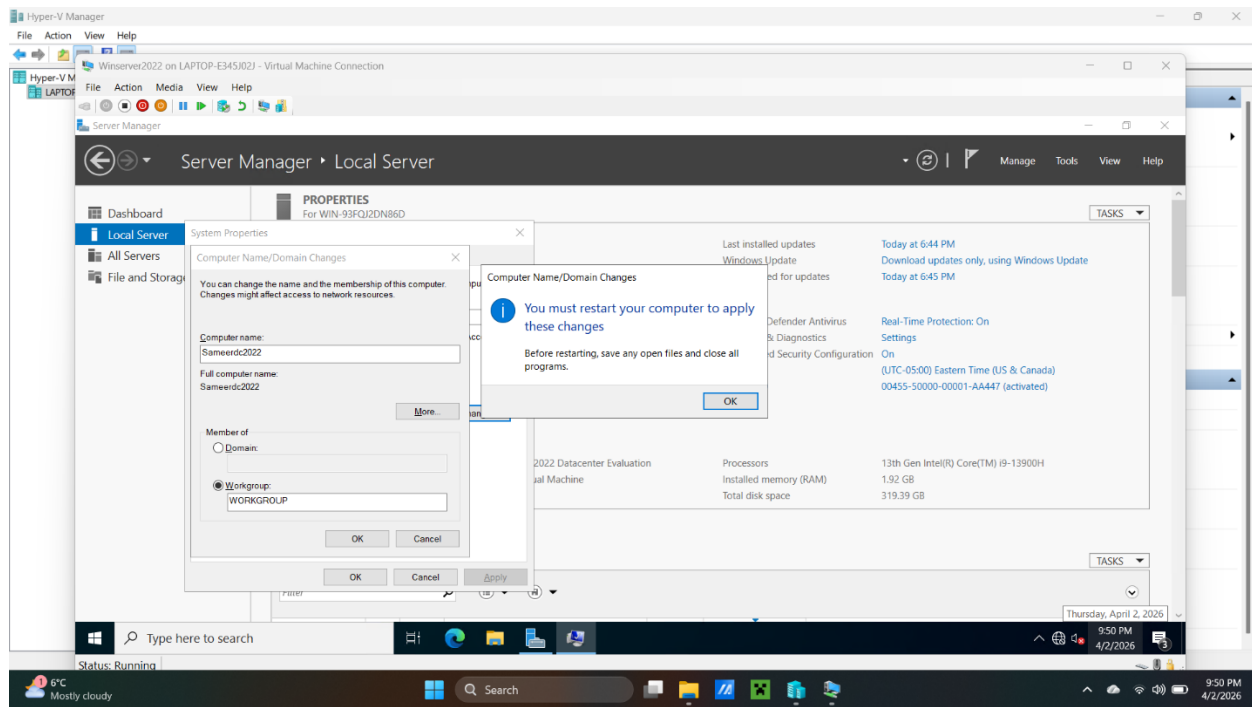

Then I clicked on change button.

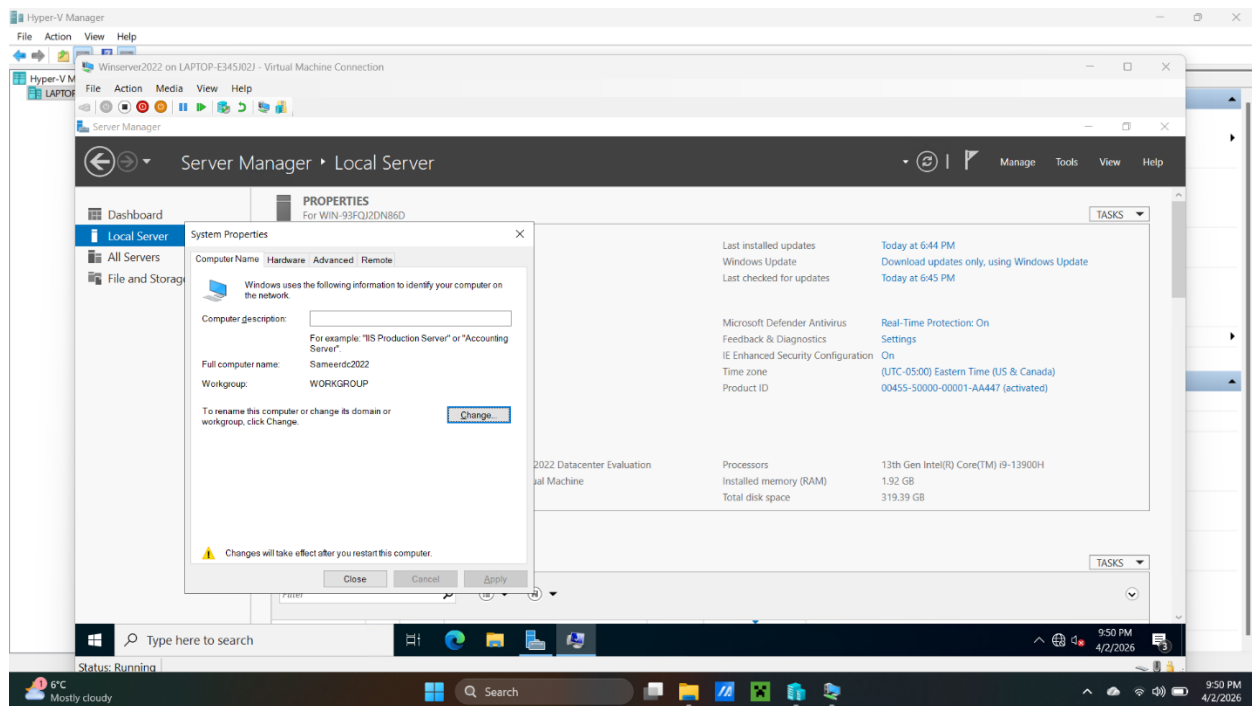

Then this interface can be seen, I renamed my system by changing highlighted area.

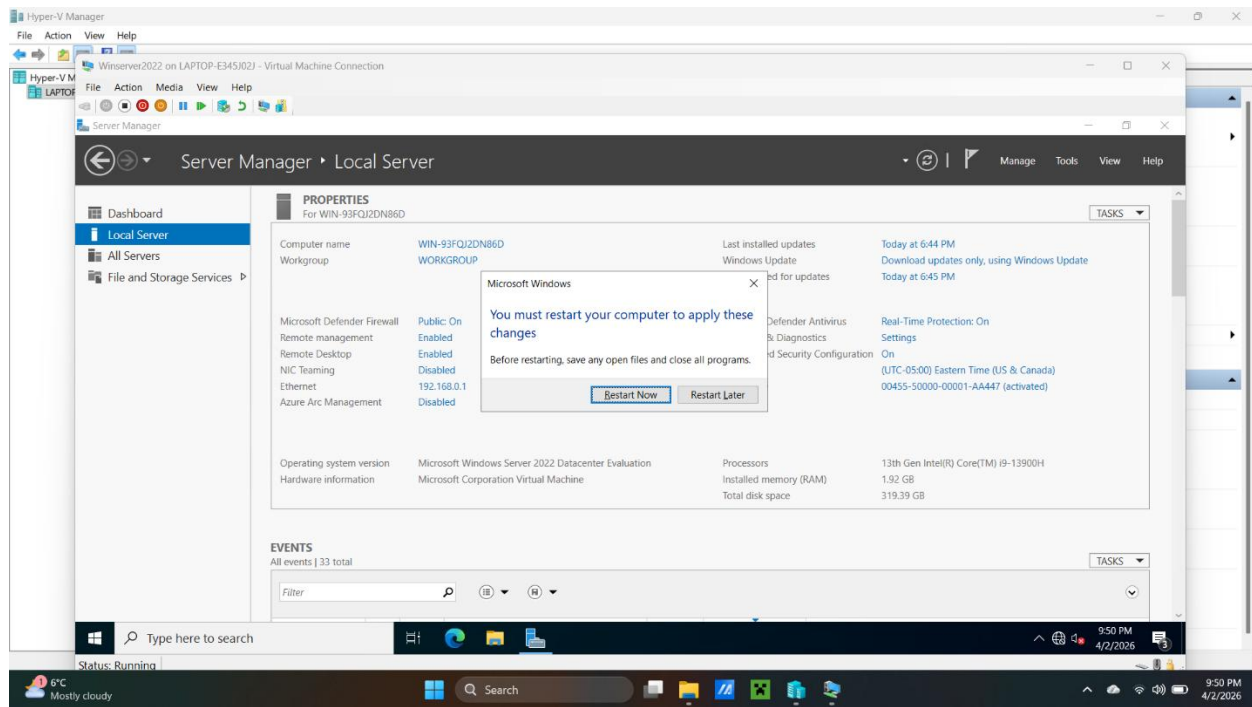

I renamed it as given in the screenshot.

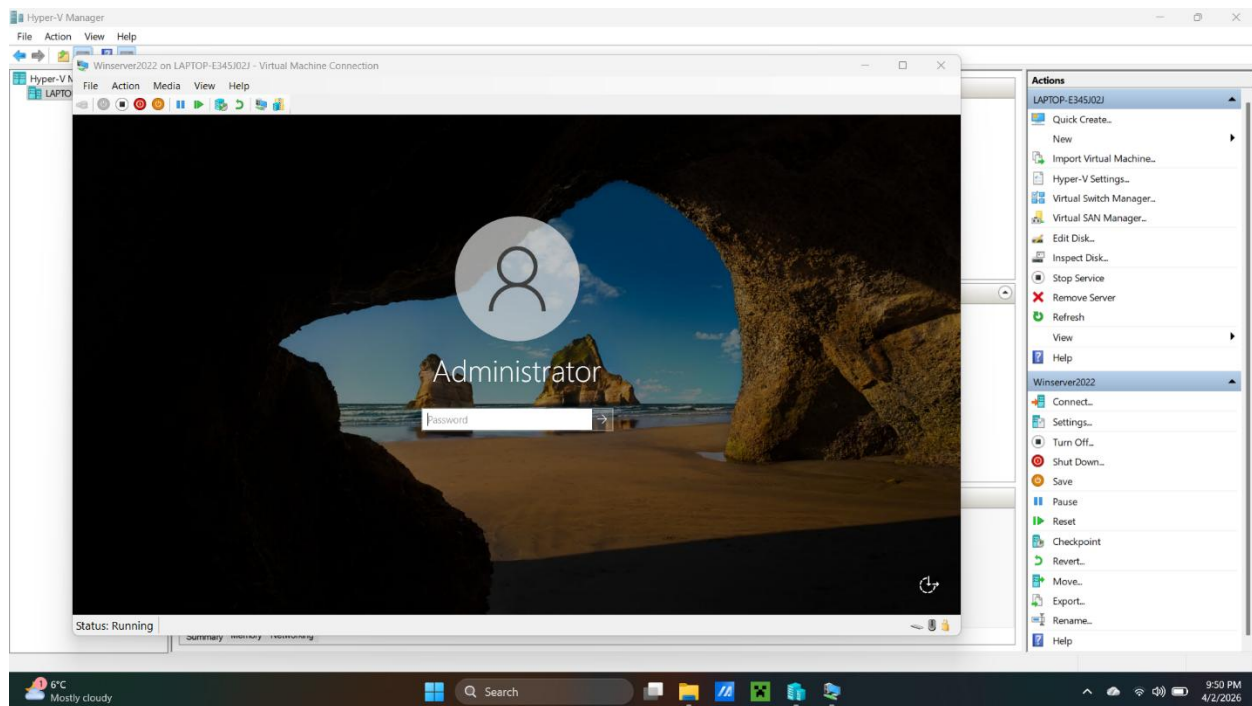

Then this pop up can be seen where I just clicked on ok button.

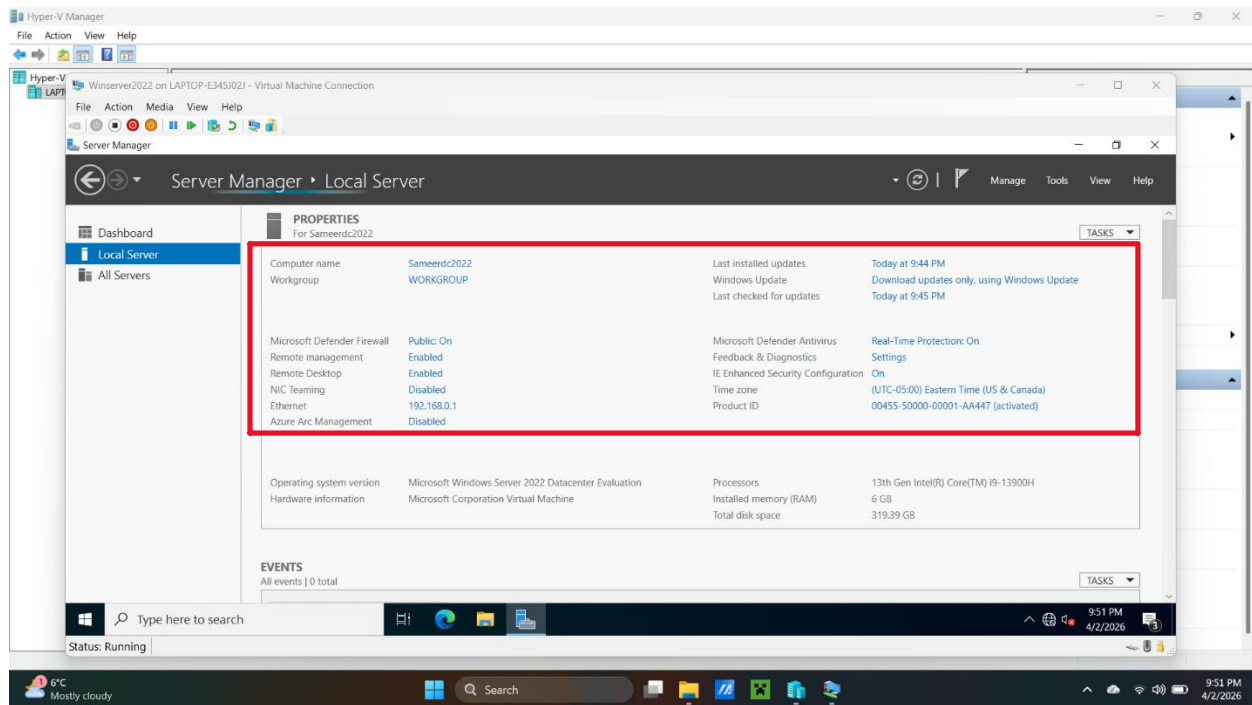

After that, I closed the system properties.

Here, I restarted my system.

Again, I logged into my system.

Here, it can be verified that I have successfully completed renaming and all the steps which I have done earlier.

Conclusion

In conclusion, initial configuration of windows server 2022 is complete.
